INDEPENDENT VALUATION · ENERGY · URANIUM

Uranium Energy Corp. UEC

No defensible target: the lenses disagree, so we show a value, not a call

NOT RATED

$3.37 indicative value

Price (2026-07-08)	$9.93
vs price	-66%
Fair value today	$3.37
Confidence	Low

We do **not rate Uranium Energy Corp.**: the result only exists inside the guardrail band. The indicative value of $3.37 a share is shown for reference only and should not be read as a call against the $9.93 share price.

Investment summary

Uranium Energy Corp. generated **$67mn** of revenue in FY2025, +29738% on the year, at a **-109.9%** EBIT margin (negative). Over the 3-year window revenue compounded at 42.4% a year, but not smoothly: growth ranged from -100% in FY2024 to +610% in FY2023 and the EBIT margin from -25247% to 6%, which is why we handle the earnings base with care. Consensus looks for revenue of $84mn in FY2026 (+25%) and EPS of -$0.11.

Two lenses feed the fair value, ranging from $2.18 to $4.55 (dispersion 35%).

The Reloj de inversión reads **Estanflación** (Stagflation) with weak conviction; Energy has a probability-weighted tilt of **+1.2 pp** a year against the US market. The cycle is context for the call, not an input to the target (page 11).

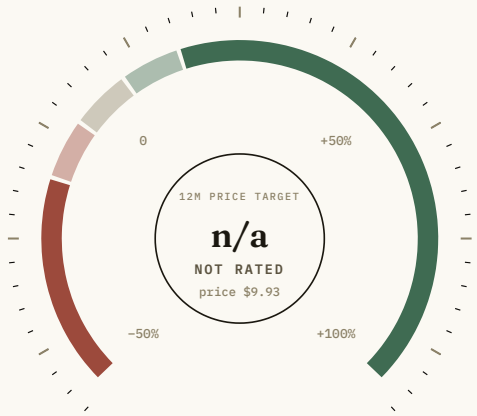

Key risks

- Through-cycle margin and multiple are estimates; a structurally lower commodity price or cost inflation would reset the normalised earnings base.
- Low-confidence valuation: the lenses disagree or the inputs carry data-quality flags. Treat the target as indicative.
- Estimate risk: consensus forecasts can be revised sharply, and the forward-multiple lenses move one-for-one with the earnings they are applied to.

WHAT WOULD CHANGE OUR MIND

- A sustained miss on FY2026 revenue (consensus +25%) or on the EBIT margin path; each 100bps of margin is worth $0.03 a share in the DCF.
- A re-rating of the sector multiple the relative lenses are anchored on, in either direction.
- A move in the cost of equity from today's 9.4%: rates and the equity risk premium are the largest single swing factor in the DCF.
- A change in the Reloj's phase reading that turns the sector's historical tilt from headwind to tailwind, or the reverse.

INVESTMENT THESIS

Why this number, and what it rests on

The lenses do not converge on a number we can defend; this page sets out what we can and cannot say.

1 · Earnings power and returns on capital

Consensus has revenue growing **+25%** in FY2026; our DCF fades growth from 25% in year one to the 2.5% terminal rate over 10 years, so no single year's step is extrapolated. The business earns **-8.5%** on invested capital against a 9.4% cost of capital, a spread of 1,788bps that means growth, on today's returns, destroys value.

The margin is where the argument sits. The latest EBIT margin of -110% compares with a through-cycle average of 6%; because revenue fell 100% in a single year, EBIT margin has swung 115pts peak-to-trough and commodity / capital-cycle industry, we treat the business as cyclical and credit only part of today's profitability as durable (a -17% terminal margin in the DCF).

Return history. ROIC has run -6% → 1% → -8% → -9% over the window, so today's -9% is a recovery from a trough rather than a steady state: the thesis needs it to hold. The WACC we compare it with is 9.4%.

2 · Valuation

Our two lenses blend to **$3.37** today, 66% below the price; the heaviest, forward ev/sales, carries 50% of the weight at $2.18.

3 · Balance sheet and cash conversion

Uranium Energy Corp. ends FY2025 with $149mn of cash against $0 of debt, a **net cash** position of $149mn; EBIT covers interest -50.8x. Free cash flow (operating cash flow less capex) was -$70mn, a -1.6% yield on the market cap, and capex ran at 1.3x depreciation.

Quality screens. The accounting screens give a Piotroski F-score of 4 out of 9, an Altman Z of 21.4 (safe zone) and Sloan accruals of -2.3%, so we lean harder on cash flow than on reported profit. Page 8 has the detail.

What the price discounts, and where we differ from the Street

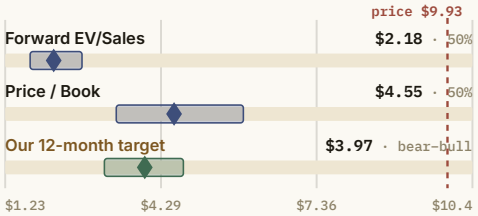

KEY TAKEAWAYS

- Not rated: indicative value $3.37.
- Consensus revenue +25% in FY2026; EBIT margin -110% today, -17% in our terminal year.
- Cycle: Stagflation (weak signal), sector tilt +1.2 pp a year.

The Reloj de inversión reads **Estanflación** (Stagflation) with weak conviction; Energy has a probability-weighted tilt of **+1.2 pp** a year against the US market. Pages 11 and 12 set out the evidence behind that reading.

Spot margins mislead at both ends of the cycle: value on mid-cycle EBITDA and through-cycle multiples, with forward multiples (scaled for earnings durability) and a mean-reverting DCF as cross-checks.

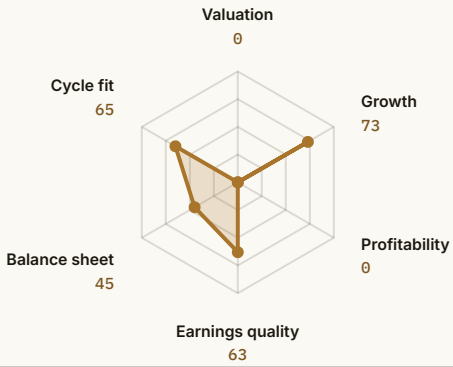

EXHIBIT 5 VALUE PER SHARE BY LENS

2 lenses blend to a fair value of **$3.37** (dispersion 35%). No Street consensus available.

VALUATION · METHOD

How $3.37 of fair value becomes a value target

Several independent answers to "what is a share worth?", weighted by what fits the business, filtered by explicit guardrails.

Spot margins mislead at both ends of the cycle: value on mid-cycle EBITDA and through-cycle multiples, with forward multiples (scaled for earnings durability) and a mean-reverting DCF as cross-checks. The profile for **UEC** is **Cyclical / Commodities (mid-cycle multiples + DCF)**; it prescribes four methods, of which two produced a usable value.

The lenses, one by one

Forward EV/Sales ($2.18 a share, 50% of the weight) applies **10.1x** to NTM revenue of $0.08bn (+25% vs last year): the lens for companies whose earnings do not yet measure value.

Price / Book ($4.55 a share, 50% of the weight) scales a 3.5x book multiple by returns on equity relative to the cost of equity (×0.60 (ROE -8.9%)).

Mid-cycle normalized EV/EBITDA was excluded because implausible: 0.1x the current price.

What the dispersion tells us. The lenses span $2.18 to $4.55, a 2.1x spread (coefficient of variation 35%). The spread is wide enough that the answer depends on which question is asked: a multiples lens capitalises today's consensus, the DCF has to earn it. We report the disagreement rather than average it away.

Weights. The profile starts from normalized 30%, ev ebitda fwd 25%, pe fwd 15% and dcf 30%. After the guardrails and the lenses that could not be built are removed, the weights are renormalised over those that remain, which is why they differ from the profile's starting point.

Guardrails: what the model is not allowed to do

Every intervention is explicit. A lens outside 0.2×–5× the share price is excluded (or winsorised if it is the only one); a lens more than 2.2× away from the median of the others is down-weighted by 60%; the published target is confined to 0.4×–2.5× the price; and with fewer than two usable lenses, or a result forced by a guardrail, the company is published NOT RATED rather than given a number we cannot defend.

- Mid-cycle normalized EV/EBITDA excluded (0.1x the current price is outside the 0.2x–5x plausibility band).
- Target 3.68 fell outside 0.4x–2.5x the price and was limited to the band edge.

From fair value to target

Fair value today $3.37 × (1 + 9.36% cost of equity) = **$3.68** model target; published target **$3.97**.

Confidence is graded **Low**: only two lenses produced a value; lens dispersion is moderate (CV 35%); a guardrail had to intervene.

Bear and bull values are the low and high ends of the lens ranges (the DCF's own bear and bull scenarios where it is present), rolled forward the same way. They bracket the model's uncertainty; they are not statistical confidence intervals.

EXHIBIT 8 THE LENSES, WEIGHTS AND RANGES

LENS	VALUE	RANGE	WEIGHT

VALUATION · RELATIVE

What the multiples say, and what we adjust before using them

Sector and peer anchors, scaled for growth, leverage and the durability of the earnings they are applied to.

On the numbers the market pays today, Uranium Energy Corp. looks difficult to value on earnings.

Where the anchor comes from

There is no usable peer set here (fewer than three peers with valid multiples), so the relative lenses are anchored on the uranium reference table: 30.0x P/E, 18.0x EV/EBITDA, 12.0x EV/Sales and 3.5x P/B, with a sector growth rate of 15%. A sector median is a starting point, not a verdict: each lens then adjusts it for the company in front of us.

What we adjust, and why

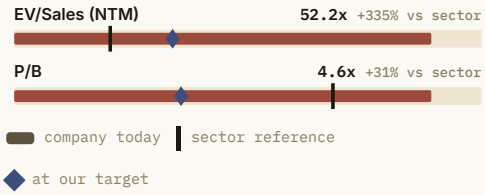

There is no usable forward P/E lens here, so the multiples evidence comes from the lenses the profile prescribes: forward ev/sales at $2.18 (50% of the weight); price / book at $4.55 (50% of the weight). Price-to-book is 4.6x against a 3.5x sector reference, and return on equity of -8.9% against a 9.4% cost of equity is what decides whether a premium to book is earned.

Cross-checks

EV/Sales is 52.2x against 12.0x for the sector, price-to-book is 4.6x against 3.5x and free-cash-flow yield is -1.6%. These do not enter the target unless a lens is built on them, but they show whether the headline multiple is flattered by one line of the accounts.

Relative valuation is only as good as the earnings it is applied to. When forward EPS is far above trailing, a low P/E can be a warning sign rather than a bargain: it is the market declining to capitalise a peak. That is why the next two pages test the earnings base before the cash-flow model is built.

VALUATION · SCENARIOS AND SENSITIVITY

Range of outcomes, and the levers that move them

Bear, base and bull cases built from the lens ranges and the DCF scenarios, with the DCF's two most important dials.

We weight three outcomes 25 / 50 / 25: a **bear** case of $3.18, a **base** case of $3.97 and a **bull** case of $4.73. The probability-weighted target is **$3.96** (-60% including dividends), close to the base case because the range is roughly symmetric.

What each case needs to be true

Bear. The DCF's bear scenario values the shares at -$0.38: slower revenue, margins that revert faster toward the through-cycle level and a higher reinvestment burden. Even then the downside to $3.18 is -68% from today's price, i.e. the market price already sits above our bear case, so the stock offers no margin of safety in a downturn.

Base. Consensus for the near years, growth fading geometrically to 2.5%, margins mean-reverting from -110% toward -17%, and a 9.4% WACC: -$0.35 a share on the cash-flow lens, $3.37 once the multiples lenses are blended.

Bull. The DCF's bull scenario reaches -$0.32: growth that fades more slowly and margins that hold closer to today's level. Our bull target of $4.73 (-52%) is the upper end of the lens ranges rolled forward.

How sensitive is the DCF?

Across a ±150bps range of WACC and ±100bps of terminal growth the DCF value per share runs from -$0.46 to -$0.27 (Exhibit 20). The cost of capital matters more than terminal growth: each 75bps of WACC moves the value by about $0.04 (-13%), against $0.00 for 50bps of terminal growth.

Stress tests

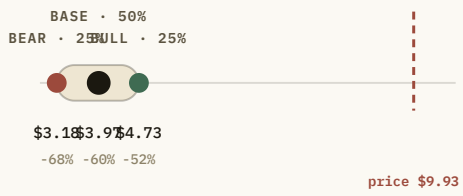

Shocking one input at a time to the DCF, the most damaging are **EBIT margin +300bps** (-24%) and revenue growth −20% (relative) (-19%); the most helpful are EBIT margin −300bps (+24%) and capex +5pts of revenue (+24%) (Exhibit 21). None of the single shocks closes the gap to the blended fair value on its own, which is useful information about where the disagreement comes from.

What each lever is worth

- **Cost of capital:** every 75bps of WACC moves fair value by ≈$0.04/share (-13%). Rate path and the equity risk premium are the single biggest swing factor.
- **Terminal growth:** 50bps of perpetuity growth is worth ≈$0.00/share — the market's read on the company's long-run competitive position.
- **Operating margin:** each 100bps of EBIT margin across the forecast is worth ≈$0.03/share — watch pricing power, mix and cost discipline in quarterly prints.
- **Top-line delivery:** our base assumes 25.0% year-one growth fading to 2.5%; sustained beats/misses versus that glide path are the cleanest re-rating trigger either way.

The sensitivity table is shaded against the current price (green above, terracotta below): when every cell is one colour the DCF has a clear view; when the base case sits near the edge of a colour change, the conclusion depends on the discount rate.

EXHIBIT 18 BEAR, BASE AND BULL TARGET

Source: SuperAnalyst valuation model.

EXHIBIT 19 SCENARIO TABLE

CASE	PROB.	TARGET	RETURN	DCF
Bear	25%	$3.18	-68%	-$0.38
Base	50%	$3.97	-60%	-$0.35
Bull	25%	$4.73	-52%	-$0.32

Weighting bear / base / bull 25 / 50 / 25 gives **$3.96** (-60% incl. dividends). Bear and bull come from the lens ranges (DCF bear/bull cases in the last column).

FINANCIAL ANALYSIS · GROWTH AND PROFITABILITY

Growth, margins and earnings

Revenue 42.4% a year over 3 years; the EBIT margin is the swing factor.

Revenue went from $23mn in FY2022 to **$67mn** in FY2025, a compound rate of **42.4%** a year. The path was anything but linear (FY2023 +610%, FY2024 -100%, FY2025 +29738%): a swing of 710 points in annual growth is the signature of a business whose revenue follows a cycle in pricing or volumes rather than a steady compounding base.

Top line

Consensus looks for revenue of **$84mn** in FY2026 (+25%). Our DCF takes consensus for the first two years and then lets growth decay geometrically toward the 2.5% terminal rate, so revenue reaches $144mn by year 10 (8.0% a year over the period). Large numbers compress growth and competition erodes it; we do not extrapolate any single year.

Margins

The EBIT margin was **-109.9%** in FY2025, negative by sector standards, within a FY2022–FY2025 range of -25247% (FY2024) to 6% (FY2023). Gross margin stood at 36.6% (from 31% at the start of the window), and net margin at -131.1%. Against a through-cycle EBIT margin of 6%, today's level is above normal; the DCF reverts 60% of the gap by the terminal year, landing at -17%.

The margin is the most valuable single input after the discount rate: each 100bps of EBIT margin across the forecast is worth about **$0.03** a share in the DCF.

Earnings per share

Diluted EPS was -$0.20 in FY2025 (FY2022 $0.02, FY2023 -$0.01, FY2024 -$0.07 before). Consensus has **-$0.11** for FY2026, which blends to **-$0.11** on a next-twelve-months basis.

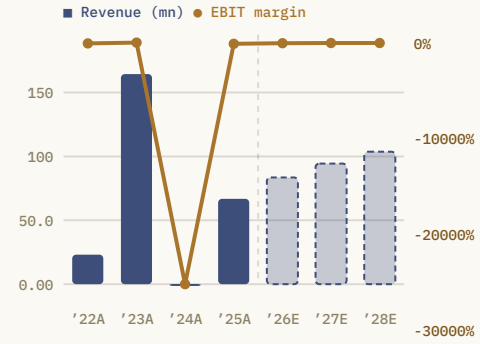

Operating leverage. Revenue rose last year but EBIT fell, so the incremental margin was negative (-25%): growth was bought with lower profitability, which is the opposite of operating leverage.

The table below the text sets out the income statement; forecast columns (shaded) are consensus where it exists and our DCF base case otherwise. Any line a provider does not report is shown as a dash rather than estimated.

WHAT TO WATCH

- FY2026 revenue against the $84mn consensus path.
- The EBIT margin against the -17% terminal level our DCF assumes.
- Gross-margin direction: it separates pricing power from volume.

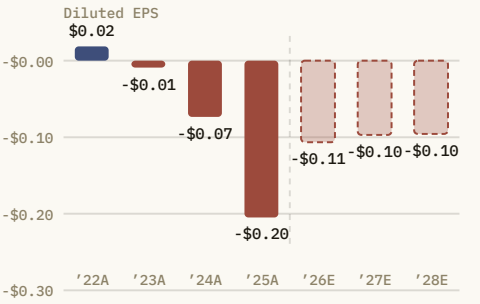

EXHIBIT 23 REVENUE AND EBIT MARGIN

Revenue compounds **+16%** a year to FY2028E on the base case; EBIT margin -110% → -40%.

Source: SuperAnalyst valuation model; Yahoo snapshot as of 2026-07-08; analyst consensus. Methodology and disclosures on page 15.

FINANCIAL ANALYSIS · CASH FLOW AND BALANCE SHEET

Cash generation, capital intensity and the balance sheet

Free cash flow of -$70mn; net cash; ROIC -9% vs WACC 9.4%.

Operating cash flow of -$64mn funded $6mn of capex in FY2025, leaving free cash flow of **-$70mn** and a -1.6% yield on the market capitalisation.

Capital intensity

Capex ran at **9%** of sales (from 5% in FY2022), 1.27x depreciation and amortisation. Above 1x the company is investing for growth, so free cash flow trails earnings until that spending matures; our DCF converges capex to 1.10x D&A by the terminal year so that growth is funded without permanent over- or under-investment.

Cash conversion

On free cash flow the shares yield -1.6%.

Balance sheet

Uranium Energy Corp. holds **$149mn** of cash and short-term investments against $0 of debt: a net cash position of $149mn. EBIT covers interest -50.8x, which our credit screen maps to C/D; the current ratio is 8.85x. Shareholders' equity is $984mn, 4.6x book at the current price.

Returns on capital

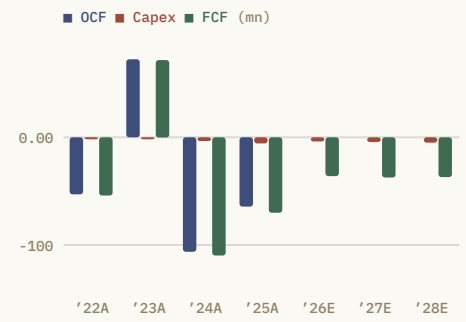

ROIC is **-8.5%** against a 9.4% WACC, a spread of -1,788bps; ROE is -8.9% and ROA -7.9%. Over the window ROIC moved -6% → 1% → -8% → -9%, so today's return is not a straight line either. The DuPont split for FY2025 is a -131.1% net margin × 0.06x asset turnover × 1.13x equity multiplier = -8.9% ROE: returns come from profitability, not from leverage.

Statements are shown on page 14; forecast cash flow is unlevered (free cash flow to the firm) so that it can be discounted at the WACC without double-counting the interest tax shield.

KEY TAKEAWAYS

- Free cash flow -$70mn.
- Net cash balance sheet.
- ROIC -9% against a 9.4% WACC.

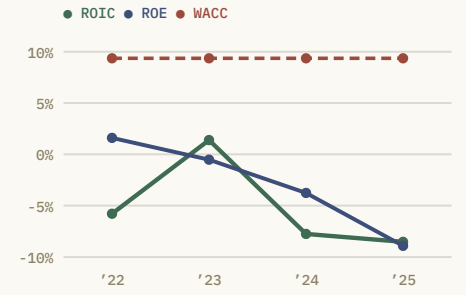

EXHIBIT 27 CASH GENERATION

FCF -70.2mn last year, -10.3x net income; capex intensity 1.3x D&A.

FINANCIAL ANALYSIS · EARNINGS QUALITY

Earnings quality and financial health

Are the reported numbers backed by cash, is the balance sheet safe, and is the earnings base durable?

Accounting-based screens give a Piotroski F-score of **4** out of 9 testable, an Altman Z of **21.4** (safe) and Sloan accruals of **-2.3%** of assets. Taken together the signals are mixed, so we lean harder on cash-flow evidence than on reported earnings.

Piotroski F-score

The score counts nine binary tests of profitability, leverage and efficiency. Uranium Energy Corp. passes four — cash flow exceeds net income (low accruals), current ratio improving, gross margin improving and asset turnover improving; it fails positive return on assets, positive operating cash flow, return on assets improving, leverage falling and no dilution (share count not up).

The failures are worth reading in context: a falling current ratio or a higher share count are typical of a company that is funding rapid growth, not of distress.

- **Profitability**: 1 of 4 passed
- **Leverage and liquidity**: 1 of 3 passed
- **Efficiency**: 2 of 2 passed

Distress risk

Altman's Z-score combines working capital, retained earnings, operating profit, market value of equity relative to liabilities and sales to assets. At **21.4** Uranium Energy Corp. sits in the safe zone (above 2.99 is safe, below 1.81 is distress). A score this high is helped by a large market capitalisation relative to liabilities, so it mainly confirms the absence of balance-sheet stress rather than measuring quality of earnings.

Accruals and the cash cycle

Sloan accruals — net income less operating cash flow, scaled by assets — are -2.3%. Readings below zero mean earnings are more than backed by cash; strongly positive readings are the classic marker of aggressive accounting. Working capital runs on DIO 683 days, DPO 91 days.

Is the earnings base durable?

No, not in full. Revenue fell 100% in a single year, EBIT margin has swung 115pts peak-to-trough and commodity / capital-cycle industry. When forward EPS is n/a the through-cycle average we scale the target multiple by **1.00**; that is a haircut, not a forecast of decline. The market has paid lower multiples for peak earnings in every cycle, and our relative lenses do the same.

Scorecard. Of six factors scored 0–100, growth (73) is the strongest and valuation (0) the weakest; the scales are given in the appendix.

KEY TAKEAWAYS

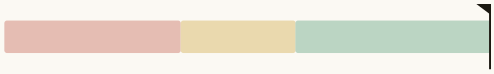

- Piotroski 4/9, Altman Z 21.4 (safe).
- Accruals -2.3% of assets: earnings are backed by cash.
- No durability haircut applied.

EXHIBIT 32 PIOTROSKI F-SCORE: 4 OF 9

VALUATION · DISCOUNTED CASH FLOW (1/2)

DCF: the assumptions behind the cash flows

Consensus for the near years, then geometric growth decay, mean-reverting margins and reinvestment tied to growth and returns.

The DCF is the cross-check that ignores what other investors pay. It values **10 years** of unlevered free cash flow plus a terminal value, discounted at the **9.36%** WACC. The early years follow consensus; thereafter growth decays geometrically and margins mean-revert, so the model cannot extrapolate a single strong year.

The drivers

Revenue growth (25.0% → 2.5% over 10y) — Year 1 follows consensus revenue for FY2026. Growth then decays geometrically from 17.0% to the 2.5% terminal rate as revenue compounds toward $0bn — competitive entry and the law of large numbers compress incremental growth; no single year's step is ever extrapolated.

EBIT margin (-109.9% → -50.0% → -16.7% (expands)) — Reported margin is -109.9%; year-1 margin is -50.0%. This is a cyclical business, so we revert 60% of the way toward the through-cycle average of 5.5%, landing at -16.7% — crediting some but not all of current profitability as durable.

Reinvestment (capex) (4.7% → 5.1% of sales) — Starts at the historical capex intensity (4.7%) against D&A of 4.6%, converging to 1.10x D&A by the terminal year — a steady state that funds growth without permanent over- or under-investment.

Working capital (-10.0% of Δrevenue) — Incremental working capital absorbs -10.0% of each year's revenue increase (historical median) — a source of cash (negative working-capital model).

Tax rate (10.0%) — Normalised to the trailing effective rate of 10.0%, applied to EBIT to derive NOPAT.

Terminal growth (2.5%) — At or below long-run nominal GDP (4.0%); a mature going concern cannot outgrow the economy in perpetuity. Terminal reinvestment is g/ROIC.

Cost of capital

The cost of equity is **9.36%**: a 4.3% risk-free rate plus a beta of **1.10** times a 4.6% equity risk premium. The beta is blended: 50% Blume-adjusted regression, 50% industry bottom-up. Debt costs 18.3% before tax (C/D (EBIT/int = -50.8x)), 16.5% after tax, and makes up 0.0% of the capital structure at market values, so the WACC is 9.36%.

Terminal value

Terminal growth is **2.5%**, at or below long-run nominal GDP, with terminal reinvestment of g ÷ ROIC (27% of NOPAT at a -1% terminal ROIC). The terminal value is **33%** of enterprise value.

VALUATION · DISCOUNTED CASH FLOW (2/2)

DCF: what it values, and what the price requires

-$0.35 a share on the cash-flow lens; the terminal value carries 33% of enterprise value.

The base case gives an enterprise value of **-$308mn** and an equity value of **-$159mn**, or **-$0.35** a share (-104% against the price). That sits in the middle of our lenses.

EXHIBIT 42 REVENUE AND FREE CASH FLOW TO THE FIRM

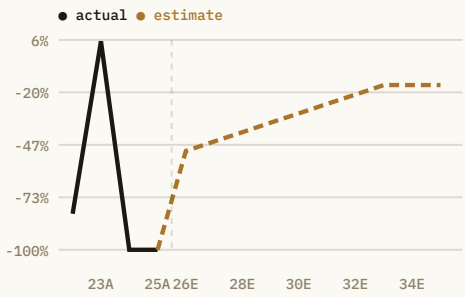

Source: SuperAnalyst valuation model.

Where the value sits

Explicit cash flows contribute -$206mn and the terminal value -$101mn (33% of EV). The terminal value implies an exit multiple of **13.6x** EBITDA, a sensible steady-state multiple for a mature business.

Terminal ROIC is -1.2% against a 9.4% WACC, so growth in perpetuity destroys value, which is why we cap it near zero.

EXHIBIT 43 EBIT MARGIN PATH

Source: SuperAnalyst valuation model.

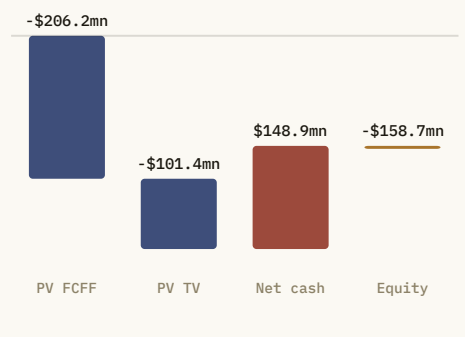

Why the DCF is negative

Free cash flow is negative through most of the forecast and the terminal value does not offset it: the business has not yet reached a scale at which it earns more than it reinvests. A negative DCF does not make the shares worthless; it says the cash-flow lens cannot support a price today, so any value rests on the optionality the revenue- and book-based lenses try to capture, which is also why the lenses disagree and the confidence grade is low.

Reading the DCF against the other lenses

Multiples capitalise consensus earnings as they are; the DCF has to earn them. Neither answer is wrong; the gap measures how much of today's profitability the market is treating as permanent.

EXHIBIT 44 ENTERPRISE VALUE TO EQUITY VALUE

Source: SuperAnalyst valuation model.

Model diagnostics

- Terminal EV/EBITDA vs today: 13.6x implied vs -63.2x current — rich
- Terminal ROIC vs WACC: -1.2% vs 9.4% — value-destructive

The bear and bull scenarios bracket the base value at -$0.38 and -$0.32; the sensitivity table on page 5 shows the effect of the discount rate and terminal growth.

MACRO CONTEXT · RELOJ DE INVERSIÓN

Where the cycle is: Estanflación (Stagflation), weak signal

Growth and inflation read from 28 FRED series, expressed as probabilities of four phases rather than a single label.

The Reloj de inversión — our own cycle model, published as a separate project — classifies the US economy each month into one of four phases from growth and inflation. Its latest reading (2026-10) is **Estanflación** (Stagflation) with **weak** conviction: 37% against 36% for Overheat.

How the Reloj reads the cycle

Twenty-eight FRED series are converted to robust z-scores and combined by principal components into a growth axis and an inflation axis; the month's position on that plane, and its uncertainty, give a probability for each phase. A phase is Recovery (growth above trend, inflation below), Overheat (both above), Stagflation (growth below, inflation above) or Reflation (both below).

The current reading

Growth sits at **-0.01σ** and inflation at **+0.19σ** of their ten-year norms, i.e. close to the centre of the plane, where phase calls are least reliable. Over three months growth has moved -0.04σ and inflation -0.07σ. The model's 12-month recession probability is **8%**.

Why a weak signal changes how we use it

Only 1.1 percentage points separate the first and second phase. When the call is that close, naming one phase and acting on it would be false precision; the more honest estimate is the probability-weighted one. That is what we use in the next section: each phase's historical sector return, weighted by today's phase probabilities.

What each phase has favoured

The Reloj's rotation playbook, built from the same history (inverse volatility), leans on different sleeves in each phase:

- **Recovery**: Consumer staples (22%), Health care (21%) and Materials (20%)
- **Overheat**: Consumer staples (42%), Financials (34%) and Energy (24%)
- **Stagflation**: Utilities (32%), Industrials (26%) and Semiconductors (22%)
- **Reflation**: Gold miners (20%), Consumer staples (18%) and Health care (18%)

How long in this phase. The Reloj has called Estanflación for three consecutive months, and for 68% of the last 8 years. A phase that has just changed carries more uncertainty than one that has persisted.

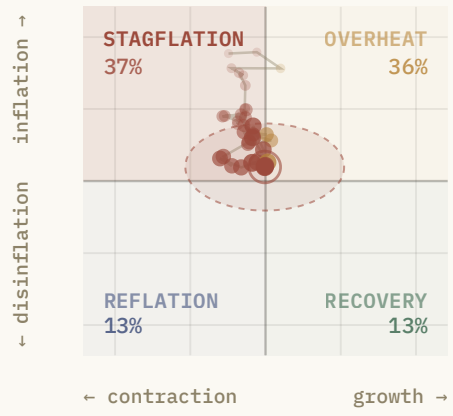

The macro read is context for the valuation. It does not move our price target, but it does tell us whether the sector a company belongs to has historically had the wind at its back or in its face.

Direction of travel. A year ago the Reloj plotted at growth -0.56σ and inflation +0.34σ; it now plots at -0.01σ and +0.19σ, a drift toward stronger growth and little change in inflation.

KEY TAKEAWAYS

- Estanflación (Stagflation), weak signal: 37% vs 36% for Overheat.
- Growth -0.01σ, inflation +0.19σ; 12-month recession probability 8%.
- We weight phases by probability; the label alone is not a forecast.

MACRO CONTEXT · SECTOR EVIDENCE

What the Energy sleeve has paid in each phase, and where that leaves us

Excess returns against the US market by phase, shrunk toward zero, with the statistics that say how much to trust them.

We map **Uranium Energy Corp.** to the Reloj's **Energy** sleeve, which it tracks through IYE and XLE; the Reloj's evidence for Energy runs back to 1970 and covers 226 months in its longest phase.

What the sector has paid in each phase

- **Recovery**: 9.3% a year on average, +0.3 pp a year versus the US market (t = +0.1, hit rate 58%, no-signal evidence)
- **Overheat**: 23.0% a year on average, +8.9 pp a year versus the US market (t = +2.4, hit rate 63%, moderate evidence)
- **Stagflation** (current): 1.1% a year on average, -5.4 pp a year versus the US market (t = -1.6, hit rate 49%, weak evidence)
- **Reflation**: 8.6% a year on average, -0.2 pp a year versus the US market (t = -0.1, hit rate 55%, no-signal evidence)

Read these with the statistics in mind. A t-statistic below about 2 means the sector's return in that phase cannot be told from chance; across all sector × phase cells the Reloj tests, only 25 of 192 survive false-discovery control. That is why the Reloj shrinks every estimate toward zero, and why we quote the shrunk figure.

The probability-weighted tilt

Weighting each phase's shrunk excess return by today's phase probabilities gives a tilt of **+1.2 pp** a year for Energy against the US market. That is small relative to the noise in the estimates: a nudge, not a thesis.

Scenario: the cycle tips. If the Reloj's runner-up, Overheat, took over, the sector's historical edge would move from -5.4 pp to +8.9 pp a year. Across the four phases Energy has done best in Overheat (+8.9 pp) and worst in Stagflation (-5.4 pp).

Playbook and ETF exposure

Energy is not in the Reloj's playbook for the current phase, but would hold 23.8% if the cycle tipped to Overheat.

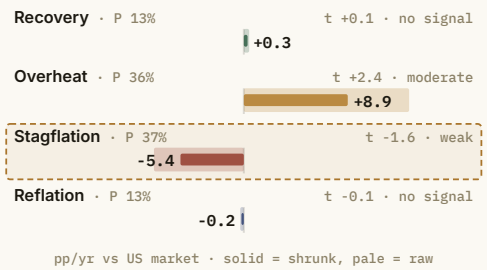

Putting the cycle and the valuation together

KEY TAKEAWAYS

- Energy tilt +1.2 pp a year, probability-weighted; current-phase edge -5.4 pp.
- Not in the playbook for the current phase.
- Context for the valuation, not an input to the target.

Source: Reloj de inversión, github.com/Perez849/reloj-inversion. The tilt describes historical behaviour; it is not an input to the target and not investment advice.

FACTORS, CATALYSTS AND RISKS

What moves the stock, and what could go wrong

Exposure scored from the model's sensitivities and the company's history; levers quantified in value per share.

We scored eight macro and company-specific factors from the model and the reported history. **High exposure**: economic cycle / demand, commodity prices, competitive erosion and pricing power / margin stability. **Low**: interest rates / discount rate, inflation / input costs, credit & refinancing and capital intensity.

What moves the stock most

Economic cycle / demand (high). Historical top-line dispersion is the cleanest read on cyclicality: a stable compounding base decouples from GDP; a volatile one imports the macro cycle into earnings. Evidence: Revenue growth volatility σ = 354.8% over 2y.

Commodity prices (high). Realised prices set margins more than management does; the gap between spot and mid-cycle margin is the mean-reversion risk embedded in today's earnings. Evidence: Spot margin -110% vs through-cycle 6%.

Competitive erosion (high). Excess returns invite entry: the wider the spread, the bigger the prize for competitors — but also the bigger the buffer before growth stops creating value. A thin spread means small competitive slippage flips growth to value destruction. Evidence: ROIC−WACC spread = -1,056bps.

What each lever is worth

- **Cost of capital:** every 75bps of WACC moves fair value by ≈$0.04/share (-13%). Rate path and the equity risk premium are the single biggest swing factor.
- **Terminal growth:** 50bps of perpetuity growth is worth ≈$0.00/share — the market's read on the company's long-run competitive position.
- **Operating margin:** each 100bps of EBIT margin across the forecast is worth ≈$0.03/share — watch pricing power, mix and cost discipline in quarterly prints.
- **Top-line delivery:** our base assumes 25.0% year-one growth fading to 2.5%; sustained beats/misses versus that glide path are the cleanest re-rating trigger either way.

Key risks

- Through-cycle margin and multiple are estimates; a structurally lower commodity price or cost inflation would reset the normalised earnings base.
- Low-confidence valuation: the lenses disagree or the inputs carry data-quality flags. Treat the target as indicative.
- Estimate risk: consensus forecasts can be revised sharply, and the forward-multiple lenses move one-for-one with the earnings they are applied to.
- Multiple risk: target multiples are anchored on sector medians; a de-rating of the peer group lowers the target regardless of company performance.
- Single third-party data source: restatements, non-recurring items or classification differences can shift the output.

How big are the risks?

Translating the risks into the DCF: EBIT margin +300bps would move the value by -24%; revenue growth −20% (relative) would move the value by -19%; WACC +100bps would move the value by -15%. These are single-factor shocks; in practice they arrive together (a de-rating and an estimate cut usually do), so the combined effect is larger than any one of them.

What we would monitor

- Delivery against the FY2026 revenue and EPS path in quarterly results, the cleanest re-rating trigger either way.
- The EBIT margin, and whether pricing, mix and cost discipline hold it near the level the DCF assumes.
- The Reloj's phase and probabilities, monthly: a move of the leading phase changes the sector's historical tilt.
- Changes to the cost of equity: rates and the equity risk premium are the single largest swing factor in the DCF.

EXHIBIT 56 FACTOR EXPOSURE

FACTOR	EXPOSURE
Interest rates / discount rate	LOW
Economic cycle / demand	HIGH
Inflation / input costs	LOW
Credit & refinancing	LOW
Commodity prices	HIGH
Competitive erosion	HIGH
Capital intensity	LOW
Pricing power / margin stability	HIGH

Net income	5.25	(3.31)	(29.22)	(87.66)	(48.44)	(44.12)	(43.43)
net margin	22.7%	-2.0%	-13045.1%	-131.1%	-58.0%	-46.8%	-41.9%
Diluted EPS	$0.02	($0.01)	($0.07)	($0.20)	($0.11)	($0.10)	($0.10)

EXHIBIT 60 BALANCE SHEET

$MN	FY2022A	FY2023A	FY2024A	FY2025A	FY2026E	FY2027E	FY2028E
Cash & short-term investments	32.54	45.61	156.3	148.9	–	–	–
Total debt	0.00	0.00	0.00	0.00	–	–	–
Net debt / (net cash)	(32.54)	(45.61)	(156.3)	(148.9)	–	–	–
Net debt / EBITDA	net cash	net cash	–	–	–	–	–
Total assets	354.2	737.6	889.8	1,108	–	–	–
Shareholders' equity	326.9	631.8	778.1	983.9	–	–	–
Book value / share	$1.17	$1.73	$1.96	$2.30	–	–	–

EXHIBIT 61 CASH FLOW

$MN	FY2022A	FY2023A	FY2024A	FY2025A	FY2026E	FY2027E	FY2028E
Operating cash flow	(52.99)	72.57	(106.5)	(64.46)	–	–	–
Capex	(1.21)	(0.66)	(3.43)	(5.70)	(3.94)	(4.49)	(4.98)
Free cash flow	(54.20)	71.92	(109.9)	(70.15)	(36.00)	(37.45)	(37.02)
FCF margin	-234.0%	43.7%	-49069.2%	-105.0%	-43.1%	-39.7%	-35.7%
FCF / net income	net cash	–	–	–	–	–	–
Capex / D&A	0.9x	0.3x	1.6x	1.3x	1.0x	1.0x	1.0x

Forecast columns: revenue, EBIT and capex are the DCF base case; net income and EPS use consensus where it covers the year; free cash flow in forecast years is unlevered (FCFF). Dashes mean the provider does not report the line.

EXHIBIT 62 RETURNS ON CAPITAL BY FISCAL YEAR

	FY2022	FY2023	FY2024	FY2025
ROE	1.6%	-0.5%	-3.8%	-8.9%
ROA	1.5%	-0.4%	-3.3%	-7.9%
ROIC	-5.8%	1.4%	-7.8%	-8.5%
Asset turnover	0.07x	0.22x	0.00x	0.06x
Equity multiplier	1.08x	1.17x	1.14x	1.13x

APPENDIX B

Methodology, definitions and disclosures

Method in one paragraph

The price target triangulates relative lenses (target multiples on consensus forward numbers, anchored on peers or a sector reference table and adjusted for durable growth, leverage and earnings durability), a 10-year DCF (consensus for the near years, geometric growth decay, mean-reverting margins) and sector models (residual income, justified P/B, FFO/AFFO, dividends, mid-cycle EBITDA), weighted by company profile. Fair value is rolled forward at the cost of equity and reduced by dividends to give a 12-month target.

Guardrails

A lens outside 0.2×–5× the share price is excluded; a lens more than 2.2× away from the median of the others is down-weighted by 60%; the published target is limited to 0.4×–2.5× the price; fewer than two usable lenses, or a result forced by a guardrail, is published NOT RATED. The Street consensus is anchored at up to 30% (scaled by analyst count; 15% when the count is unknown) and is always shown separately.

Rating bands

On the 12-month expected total return: OVERWEIGHT above +15%, ADD +5% to +15%, NEUTRAL −5% to +5%, REDUCE −15% to −5%, UNDERWEIGHT below −15%.

Scorecard scales

Valuation: expected return −30% to +50% mapped to 0–100. Growth: durable EPS growth 0–25% and FY+1 revenue −5% to +30%. Profitability: ROIC − WACC from −5 to +25 points and EBIT margin 0–35%. Earnings quality: Piotroski share of tests passed, OCF/net income 0.5–1.2 and accruals. Balance sheet: net debt/EBITDA, interest cover and Altman zone. Cycle fit: Reloj tilt −4 to +4 pp a year.

Quality screens

Piotroski F: nine binary tests of profitability, leverage/liquidity and efficiency; tests that cannot be computed from the available statement lines are excluded, not failed. Altman Z (original industrial form): above 2.99 safe, 1.81–2.99 grey, below 1.81 distress. Sloan accruals: (net income − operating cash flow) ÷ average assets.

Reloj de inversión

Phase probabilities and sector evidence come from the Reloj de inversión project's published data (github.com/Perez849/reloj-inversion). Tilt = Σ phase probability × shrunk excess return of the sector in that phase. It describes historical behaviour and is not an input to the price target.

Data and limits

Fundamentals and consensus come from Yahoo snapshot as of 2026-07-08; the company was classified as **Cyclical / Commodities (mid-cycle multiples + DCF)**. Forward numbers are analyst consensus where available and reported figures otherwise. A single third-party source can contain restatements, one-off items or classification differences that move the output; the model flags what it can detect and refuses to publish a number it cannot defend.

Definitions

EV: enterprise value = market capitalisation + net debt + minorities. NTM: next twelve months, a time-weighted blend of the two nearest forecast fiscal years. FCFF: free cash flow to the firm = NOPAT + D&A − capex − change in working capital. WACC: weighted average cost of capital. ROIC: NOPAT ÷ invested capital (debt + equity − cash). PEG: P/E ÷ durable earnings growth. Tilt: probability-weighted excess return of a sector against the US market, in percentage points a year.

Disclaimer

This research note is generated by an automated, sector-aware valuation engine from public data. It is an analytical tool, not investment advice, a recommendation or an offer to transact, and it is no substitute for fundamental judgement. Past performance and historical sector behaviour are not guides to future returns. Do your own due diligence.
