Sandisk Corporation SNDK

Priced above what the fundamentals can support

UNDERWEIGHT

$1,221.65 target · 12m

Price (2026-07-09)	$1,727.18
12m total return	-29%
Fair value today	$995.09
Confidence	Medium

We rate **Sandisk Corporation UNDERWEIGHT** with a 12-month price target of **$1,221.65**, **29%** below the $1,727.18 share price. The target starts from our blended fair value of $995.09 a share, rolls it forward a year at the 9.4% cost of equity and gives the Street consensus a 15% weight as a deliberate hedge against model error.

Investment summary

Sandisk Corporation generated **$7.36bn** of revenue in FY2025, +10% on the year, at a **6.9%** EBIT margin (thin). Over the 2-year window revenue compounded at 9.9% a year. Consensus looks for revenue of $19.77bn in FY2026 (+169%) and EPS of $66.41, rising to $204.47 in FY2027.

At $1,727.18 the shares trade on **12.8x** NTM earnings against a 17.0x reference for hardware & storage (−25%) and on 9.8x EV/EBITDA against 11.0x (−11%). The headline discount is not the whole story: forward EPS is 20.0x what the business has earned through the cycle, so we scale target multiples by 0.60. The market pays less for peak earnings, and so do we.

The Street's mean 12-month target is $1,975.95 (+14%). Our model-only target of $1,088.54 sits 45% below it; the published number blends the two so that neither a model error nor a consensus drift dominates.

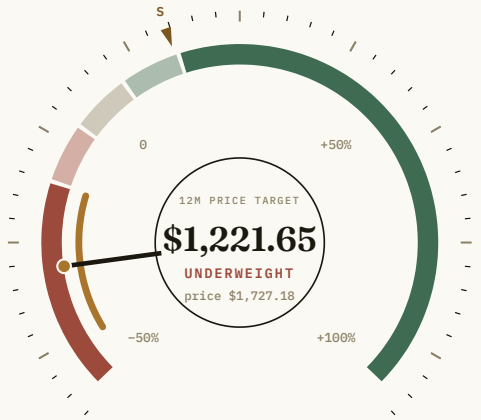

The Reloj de inversión reads **Stagflation** with weak conviction; the Technology sleeve has a probability-weighted tilt of **−1.3 pp** a year against the US market. The cycle is context for the call, not an input to the target (page 11).

A reverse DCF shows the price discounts year-one revenue growth of **184.1%** against our 168.8% base, so the market is asking for more than we model. That is the cleanest single measure of how demanding the price is.

Key risks

- Earnings are cyclically elevated: forward EPS is 20.0x the through-cycle average. A normalisation of pricing, volumes or margins would reset the earnings base the multiples are applied to.
- Our model-only target is 45% below the Street consensus ($1,975.95); where the model is right the stock has an information edge, where it is wrong the Street's inputs deserve more weight.
- Estimate risk: consensus forecasts can be revised sharply, and the forward-multiple lenses move one-for-one with the earnings they are applied to.

INVESTMENT THESIS

Why this number, and what it rests on

At $1,727.18 the shares discount more than our $995.09 fair value supports; the debate is how much of the growth is already in the price.

1 · Earnings power and returns on capital

Consensus has revenue growing **+169%** in FY2026 and +143% in FY2027; our DCF fades growth from 169% in year one to the 2.5% terminal rate over 10 years, so no single year's step is extrapolated. The business earns **3.9%** on invested capital against a 9.3% cost of capital, a shortfall of 546bps, so on today's returns growth destroys value.

The margin is where the argument sits. The latest EBIT margin of 7% compares with a through-cycle average of −7%; the model flags the business as cyclical (swing from trailing losses to large forward profits, cycle inflection), so we credit only part of the current margin as durable (a 10% terminal margin in the DCF).

2 · Valuation

Our three lenses blend to **$995.09** today, 42% below the price; the heaviest, discounted cash flow (FCFF), carries 39% of the weight at $537.17.

At our target the stock would trade on **9.0x** NTM earnings against 17.0x for the sector, i.e. a discount that we think is justified given the durability haircut.

3 · Balance sheet and cash conversion

Sandisk Corporation ends FY2025 with $1.48bn of cash against $2.04bn of debt, net debt of $561mn (leverage ratios against EBITDA are not available); EBIT covers interest 8.0x. Free cash flow (operating cash flow less capex) was −$120mn, a 0.0% yield on the market cap, and capex ran at 1.3x depreciation.

Quality screens. The accounting screens give a Piotroski F-score of 6 out of 9, an Altman Z of 41.6 (safe zone) and Sloan accruals of −13.0%, which supports taking reported earnings at face value. Page 8 has the detail.

What the price discounts, and where we differ from the Street

Solving the DCF backwards for the current price gives year-one revenue growth of **184.1%** (terminal growth 8.6%) against our 168.8% base. The market therefore already needs more than we forecast; delivery at our base case would not be enough to justify the price on the DCF alone.

Against a Street mean of $1,975.95 (+14%), our model-only target of $1,088.54 is 45% lower. A discount to consensus is the natural outcome when the model haircuts peak earnings that analysts capitalise in full.

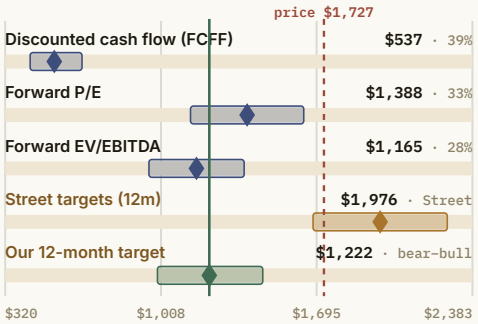

In summary

KEY TAKEAWAYS

- UNDERWEIGHT: $1,221.65 target (−29%), $995.09 fair value, 9.4% cost of equity.
- Consensus revenue +169% in FY2026; EBIT margin 7% today, 10% in our terminal year.
- 12.8x NTM P/E against 17.0x for the sector; 9.0x at our target.
- Cycle: Stagflation (weak signal), sector tilt −1.3 pp a year.

Cycle context. The Reloj's reading of the cycle and the sector's historical record in each phase are set out on pages 11 and 12; they inform how we size the call, not the target itself.

VALUATION · METHOD

How $995.09 of fair value becomes a $1,221.65 target

Several independent answers to "what is a share worth?", weighted by what fits the business, filtered by explicit guardrails.

Priced like the sell-side prices it: a target multiple on forward earnings and EBITDA (peer-anchored, adjusted for growth and earnings durability), cross-checked against a 10-year FCFF DCF whose growth fades and whose margins mean-revert. The profile for **SNDK** is **Standard (forward multiples + DCF)**; it prescribes four methods, of which three produced a usable value.

The lenses, one by one

Discounted cash flow (FCFF) ($537.17 a share, 39% of the weight) values ten years of free cash flow to the firm at a 9.35% WACC with 2.50% terminal growth; the terminal value is $27.15bn (34% of EV). Growth fades toward the terminal rate and margins mean-revert, so it does not extrapolate today's profitability; here it sits below the multiples lenses.

Forward P/E ($1,387.82 a share, 33% of the weight) applies a **10.2x** target multiple to NTM EPS of $135.44. The multiple starts from an anchor of 17.0x (Hardware & storage reference 17.0x, no usable peer set), is scaled by 1.00 for durable growth (9.0% durable growth vs 9.0% sector) and by 0.60 for earnings durability.

Forward EV/EBITDA ($1,164.91 a share, 28% of the weight) capitalises NTM EBITDA of $26.10bn at **6.6x**, then bridges to equity through net debt. The anchor is 11.0x; growth and durability adjustments follow the same logic as the P/E lens, which makes it a capital-structure-neutral cross-check.

What the dispersion tells us. The lenses span $537.17 to $1,387.82, a 2.6x spread (coefficient of variation 35%). The spread is wide enough that the answer depends on which question is asked: a multiples lens capitalises today's consensus, while the DCF has to earn it. We report the disagreement rather than average it away.

Weights. The profile starts from DCF 35%, forward P/E 30%, forward EV/EBITDA 25% and dividend discount model 10%. After the guardrails and the lenses that could not be built are removed, the weights are renormalised over those that remain, which is why they differ from the profile's starting point.

Guardrails: what the model is not allowed to do

Every intervention is explicit. A lens outside 0.2×–5× the share price is excluded (or winsorised if it is the only one); a lens more than 2.2× away from the median of the others is down-weighted by 60%; the published target is confined to 0.4×–2.5× the price; and with fewer than two usable lenses, or a result forced by a guardrail, the company is published NOT RATED rather than given a number we cannot defend.

- Target anchored 15% to the Street consensus ($1,975.95); model-only target $1,088.54.

From fair value to target

Fair value today $995.09 × (1 + 9.39% cost of equity) = **$1,088.54** model target; the Street mean of $1,975.95 at 15% weight moves it to **$1,221.65**.

Confidence is graded **Medium**: 3 independent lenses agree on a valuation; lens dispersion is moderate (CV 35%); 1 data-quality / earnings-quality flag(s).

Bear and bull values are the low and high ends of the lens ranges (the DCF's own bear and bull scenarios where it is present), rolled forward the same way. They bracket the model's uncertainty; they are not statistical confidence intervals.

VALUATION · RELATIVE

What the multiples say, and what we adjust before using them

Sector and peer anchors, scaled for growth, leverage and the durability of the earnings they are applied to.

On the numbers the market pays today, Sandisk Corporation looks cheap on earnings (12.8x NTM against 17.0x for hardware & storage, −25%) and cheap on enterprise value (9.8x EV/EBITDA against 11.0x).

Where the anchor comes from

There is no usable peer set here (fewer than three peers with valid multiples), so the relative lenses are anchored on the hardware & storage reference table: 17.0x P/E, 11.0x EV/EBITDA, 2.5x EV/Sales and 5.0x P/B, with a sector growth rate of 9%. A sector median is a starting point, not a verdict: each lens then adjusts it for the company in front of us.

What we adjust, and why

Growth. The anchor is scaled ×1.00 (9.0% durable growth vs 9.0% sector) — the market pays for growth that lasts, so we use durable earnings growth of 9.0% (historical revenue CAGR, capped at 15%; capped at sector growth, cyclical) rather than a one-year consensus jump.

Earnings durability. Forward EPS of $135.44 is 20.0x the through-cycle EPS of −$10.24, so the target multiple is scaled by **×0.60**. This is the single largest adjustment and the main reason our target sits below consensus.

The result is a target P/E of **10.2x** applied to NTM EPS, worth $1,387.82 a share.

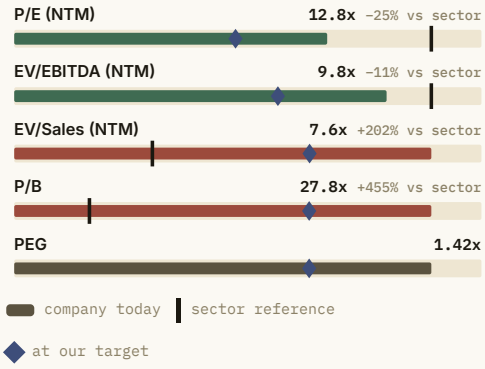

Cross-checks

EV/Sales is 7.6x against 2.5x for the sector, price-to-book is 27.8x against 5.0x, free-cash-flow yield is 0.0% and the PEG ratio is 1.42x. These do not enter the target unless a lens is built on them, but they show whether the headline multiple is flattered by one line of the accounts.

Growth-adjusted view. The PEG ratio of 1.42x divides the P/E by durable growth; below 1 the market is paying less than a point of multiple per point of growth. Treat it with caution when growth is a cyclical rebound rather than a trend.

Relative valuation is only as good as the earnings it is applied to. When forward EPS is far above trailing, a low P/E can be a warning sign rather than a bargain: it is the market declining to capitalise a peak. That is why the financial analysis that follows tests the earnings base before the cash-flow model is built.

VALUATION · SCENARIOS AND SENSITIVITY

Range of outcomes, and the levers that move them

Bear, base and bull cases built from the lens ranges and the DCF scenarios, with the DCF's two most important dials.

We weight three outcomes 25 / 50 / 25: a **bear** case of $992.13, a **base** case of $1,221.65 and a **bull** case of $1,457.00. The probability-weighted target is **$1,223.11** (−29% including dividends), close to the base case because the range is roughly symmetric.

What each case needs to be true

Bear. The DCF's bear scenario values the shares at $430.76: slower revenue, margins that revert faster toward the through-cycle level and a higher reinvestment burden. Our published bear target of $992.13 (−43% from today's price) blends that with the lower ends of the multiples lenses, so it is the multiples, not the cash-flow model, that set the floor of the range. On the DCF's own terms the shares offer no margin of safety in a downturn.

Base. Consensus for the near years, growth fading to 2.5%, margins mean-reverting from 7% toward 10%, and a 9.3% WACC: $537.17 a share on the cash-flow lens, $995.09 once the multiples lenses are blended.

Bull. The DCF's bull scenario reaches $659.71: growth that fades more slowly and margins that hold closer to today's level. Our published bull target of $1,457.00 (−16%) is the upper end of the lens ranges rolled forward.

How sensitive is the DCF?

Across a ±150bps range of WACC and ±100bps of terminal growth the DCF value per share runs from $472.21 to $626.11 (Exhibit 23). The cost of capital matters more than terminal growth: each 75bps of WACC moves the value by about $36.84 (7%), against $0.89 for 50bps of terminal growth.

Stress tests

Shocking one input at a time to the DCF, the most damaging are **revenue growth 20% lower** (−26%) and capex +5 points of revenue (−24%); the most helpful are revenue growth 20% higher (+32%) and EBIT margin +300bps (+21%) (Exhibit 25). None of the single shocks closes the gap to the blended fair value on its own, which is useful information about where the disagreement comes from.

How sensitive is the multiple-based value?

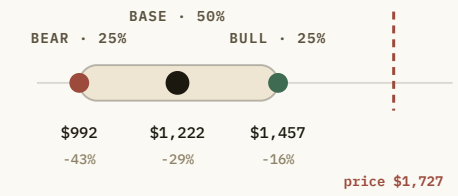

Forward earnings and the target multiple are the inputs that matter most. A 10% change in either NTM EPS or the target multiple moves the forward P/E value by about $138.15 a share (they enter multiplicatively); across the grid (Exhibit 24) the value runs from $884.15 to $1,989.34.

What each lever is worth

- **Cost of capital:** every 75bps of WACC moves fair value by ≈$36.84/share (7%). Rate path and the equity risk premium are the single biggest swing factor.
- **Terminal growth:** 50bps of perpetuity growth is worth ≈$0.89/share — the market's read on the company's long-run competitive position.
- **Operating margin:** each 100bps of EBIT margin across the forecast is worth ≈$37.98/share — watch pricing power, mix and cost discipline in quarterly prints.
- **Top-line delivery:** our base assumes 168.8% year-one growth fading to 2.5%; sustained beats/misses versus that glide path are the cleanest re-rating trigger either way.

The sensitivity tables are shaded against the current price (green above, terracotta below): when every cell is one colour the DCF has a clear view; when the base case sits near the edge of a colour change, the conclusion depends on the inputs.

EXHIBIT 21 BEAR, BASE AND BULL TARGET

FINANCIAL ANALYSIS · GROWTH AND PROFITABILITY

Growth, margins and earnings

Revenue 9.9% a year over 2 years; the EBIT margin is the swing factor.

Revenue went from $6.09bn in FY2023 to **$7.36bn** in FY2025, a compound rate of **9.9%** a year. Growth was steady (FY2024 +9%, FY2025 +10%), which makes the forward path easier to underwrite.

Top line

Consensus looks for revenue of **$19.77bn** in FY2026 (+169%) and $48.13bn in FY2027 (+143%). Our DCF takes consensus for the first two years and then fades growth toward the 2.5% terminal rate, so revenue reaches $78.79bn by year 10 (26.8% a year over the period). Large numbers compress growth and competition erodes it; we do not extrapolate any single year.

Margins

The EBIT margin was **6.9%** in FY2025 (thin, below the 13% sector reference), within a range of −21% (FY2023) to +7% (FY2025) over the window. Gross margin stood at 30.1% (from 7% at the start of the window), and net margin at −22.3%. Against a through-cycle EBIT margin of −7%, today's level is well above normal; the DCF reverts 60% of the gap by the terminal year, landing at 10%.

The margin is the most valuable single input after the discount rate: each 100bps of EBIT margin across the forecast is worth about **$37.98** a share in the DCF.

Earnings per share

Diluted EPS was −$11.32 in FY2025 (FY2023 −$14.78, FY2024 −$4.63 before). Consensus has **$66.41** for FY2026 and **$204.47** for FY2027, which blends to **$135.44** on a next-twelve-months basis. That NTM figure is **20.0x** the −$10.24 the business has earned on average through the cycle, so we capitalise it at a multiple scaled by 0.60: the market does not pay a full multiple for earnings that are a multiple of normal.

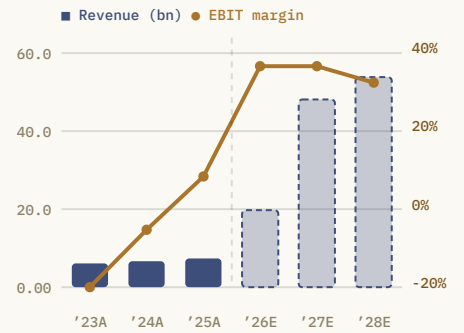

Operating leverage. Last year each extra $1 of revenue brought $1.37 of EBIT (above the 7% average margin), a sign of strong operating leverage as fixed costs were absorbed.

The table below the text sets out the income statement; forecast columns (shaded) are consensus where it exists and our DCF base case otherwise. Any line a provider does not report is shown as a dash rather than estimated.

WHAT TO WATCH

- FY2026 revenue against the $19.77bn consensus path.
- The EBIT margin against the 10% terminal level our DCF assumes.
- Gross-margin direction: it separates pricing power from volume.

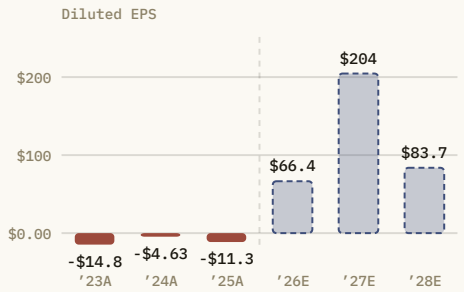

EXHIBIT 26 REVENUE AND EBIT MARGIN

Revenue compounds **+94%** a year to FY2028E on the base case; EBIT margin 7% → 31%.

Forecast columns: revenue, EBIT and capex are the DCF base case; net income and EPS use consensus where it covers the year; free cash flow in forecast years is unlevered (FCFF). Dashes mean the provider does not report the line.

FINANCIAL ANALYSIS · CASH FLOW AND BALANCE SHEET

Cash generation, capital intensity and the balance sheet

Free cash flow of −$120mn; net debt $561mn; ROIC 4% vs WACC 9.3%.

Operating cash flow of $84mn funded $204mn of capex in FY2025, leaving free cash flow of **−$120mn** and a 0.0% yield on the market capitalisation.

Capital intensity

Capex ran at **3%** of sales (from 4% in FY2023), 1.25x depreciation and amortisation. Above 1x the company is investing for growth, so free cash flow trails earnings until that spending matures; our DCF converges capex to 1.10x D&A by the terminal year so that growth is funded without permanent over- or under-investment.

Cash conversion

Free cash flow was negative (−$120mn): the business is consuming cash rather than generating it, and that is funded from the balance sheet ($1.48bn of cash). On free cash flow the shares yield 0.0%.

Balance sheet

Sandisk Corporation holds **$1.48bn** of cash and short-term investments against $2.04bn of debt: net debt of $561mn (leverage ratios against EBITDA are not available). EBIT covers interest 8.0x, which our credit screen maps to AA; the current ratio is 3.56x. Shareholders' equity is $9.22bn, 27.8x book at the current price.

Returns on capital

ROIC is **3.9%** against a 9.3% WACC, a spread of −546bps; ROE is −17.8% and ROA −12.6%. The DuPont split for FY2025 is a −22.3% net margin × 0.57x asset turnover × 1.41x equity multiplier = −17.8% ROE: the loss, not leverage, drives the negative return.

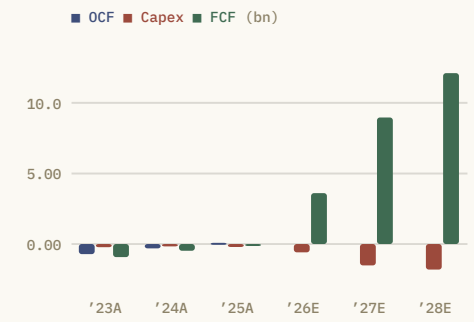

Working capital. The cash conversion cycle is 175 days (receivables 53, inventory 148, payables 26). In a growth phase that cycle consumes cash; if growth slows, the same cycle releases it, which is part of why free cash flow can run ahead of earnings in a downturn.

Statements are shown on page 14; forecast cash flow is unlevered (free cash flow to the firm) so that it can be discounted at the WACC without double-counting the interest tax shield.

KEY TAKEAWAYS

- Free cash flow −$120mn.
- Net debt $561mn.
- ROIC 4% against a 9.3% WACC.

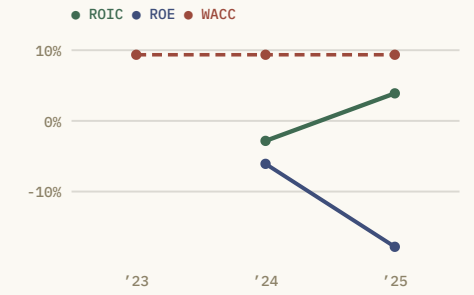

EXHIBIT 30 CASH GENERATION

FCF -0.1bn last year; capex intensity 1.3x D&A.

FINANCIAL ANALYSIS · EARNINGS QUALITY

Earnings quality and financial health

Are the reported numbers backed by cash, is the balance sheet safe, and is the earnings base durable?

Accounting-based screens give a Piotroski F-score of **6** out of 9 testable, an Altman Z of **41.6** (safe) and Sloan accruals of **−13.0%** of assets. Taken together they describe a business whose reported earnings are backed by cash and a balance sheet that is not under strain; the open question is durability, not integrity.

Piotroski F-score

The score counts nine binary tests of profitability, leverage and efficiency. Sandisk Corporation passes six — positive operating cash flow, cash flow exceeds net income (low accruals), current ratio improving, no dilution (share count not up) and two more; it fails three: positive return on assets, return on assets improving and leverage falling.

The failures are worth reading in context: failing the level tests means the business is not yet earning a positive return on its assets or generating operating cash, which is the failure that matters most.

- **Profitability**: 2 of 4 passed
- **Leverage and liquidity**: 2 of 3 passed
- **Efficiency**: 2 of 2 passed

Distress risk

Altman's Z-score combines working capital, retained earnings, operating profit, market value of equity relative to liabilities and sales to assets. At **41.6** Sandisk Corporation sits in the safe zone (above 2.99 is safe, below 1.81 is distress). A score this high is helped by a large market capitalisation relative to liabilities, so it mainly confirms the absence of balance-sheet stress rather than measuring quality of earnings.

Accruals and the cash cycle

Sloan accruals — net income less operating cash flow, scaled by assets — are −13.0%. Readings below zero mean earnings are more than backed by cash; strongly positive readings are the classic marker of aggressive accounting. Working capital runs on DSO 53 days, DIO 148 days, DPO 26 days, a cash conversion cycle of 175 days. A cycle of that length ties up cash as the company grows, which is why the DCF charges 14.9% of incremental revenue to working capital.

Is the earnings base durable?

No, not in full. The model flags the earnings as cyclical: swing from trailing losses to large forward profits, cycle inflection. When forward EPS is 20.0x the through-cycle average we scale the target multiple by **0.60**; that is a haircut, not a forecast of decline. Markets typically pay lower multiples for peak earnings, and our relative lenses do the same.

Scorecard. Of six factors scored 0–100, earnings quality (83) is the strongest and valuation (1) the weakest; the scales are given in the appendix.

KEY TAKEAWAYS

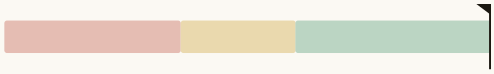

- Piotroski 6/9, Altman Z 41.6 (safe).
- Accruals −13.0% of assets: earnings are backed by cash.
- Durability factor 0.60: forward EPS is 20.0x the through-cycle level.

EXHIBIT 35 PIOTROSKI F-SCORE: 6 OF 9

VALUATION · DISCOUNTED CASH FLOW (1/2)

DCF: the assumptions behind the cash flows

Consensus for the near years, then a steady growth fade, mean-reverting margins and reinvestment tied to growth and returns.

The DCF is the cross-check that ignores what other investors pay. It values **ten years** of unlevered free cash flow plus a terminal value, discounted at the **9.35%** WACC. The early years follow consensus; thereafter growth fades toward the terminal rate and margins mean-revert, so the model cannot extrapolate a single strong year.

The drivers

Revenue growth: `168.8% → 2.5% over 10y`. Years 1–2 follow consensus revenue for FY2026 and FY2027. Growth then fades on a convex path (faster early, as cyclical growth tends to mean-revert) from 14.0% to the 2.5% terminal rate as revenue compounds toward $79bn — competitive entry and the law of large numbers compress incremental growth; no single year's step is ever extrapolated.

EBIT margin: `6.9% → 35.0% → 9.8% (expands)`. Reported margin is 6.9%; year-1 margin is 35.0% (consensus implies 67%; capped at 35%, 1.5x the highest margin ever reported). This is a cyclical business, so we revert 60% of the way toward the through-cycle average of −7.0%, landing at 9.8% — crediting some but not all of current profitability as durable.

Reinvestment (capex): `3.0% → 4.7% of sales`. Starts at the historical capex intensity (3.0%) against D&A of 4.3%, converging to 1.10x D&A by the terminal year — a steady state that funds growth without permanent over- or under-investment.

Working capital: `14.9% of Δrevenue`. Incremental working capital absorbs 14.9% of each year's revenue increase (historical median) — a cash drag as the business scales.

Tax rate: `25.0%`. Normalised to the trailing effective rate of 25.0%, applied to EBIT to derive NOPAT.

Terminal growth: `2.5%`. At or below long-run nominal GDP (4.0%); a mature going concern cannot outgrow the economy in perpetuity. Terminal reinvestment is g/ROIC.

Cost of capital

The cost of equity is **9.39%**: a 4.3% risk-free rate plus a beta of **1.11** times a 4.6% equity risk premium. The beta is industry bottom-up (Hardware & storage). Debt costs 5.1% before tax (AA, EBIT/int = 8.0x), 3.8% after tax, but carries almost no weight in the capital structure (0.8%), so the WACC is essentially the cost of equity at 9.35%.

Terminal value

Terminal growth is **2.5%**, at or below long-run nominal GDP, with terminal reinvestment of g ÷ ROIC (27% of NOPAT at a 6% terminal ROIC). The terminal value is **34%** of enterprise value.

VALUATION · DISCOUNTED CASH FLOW (2/2)

DCF: what it values, and what the price requires

$537.17 a share on the cash-flow lens; the terminal value carries 34% of enterprise value.

The base case gives an enterprise value of **$80.11bn** and an equity value of **$79.55bn**, or **$537.17** a share (−69% against the price). That is the lowest of our lenses, and the triangulation weights it accordingly.

Where the value sits

Explicit cash flows contribute $52.96bn and the terminal value $27.15bn (34% of EV). The terminal value implies an exit multiple of **5.7x** EBITDA, a steady-state multiple for a mature business.

Terminal ROIC is 5.5% against a 9.3% WACC, so growth in perpetuity destroys value, which is why we cap it near zero.

Why the DCF sits below the multiples

Multiples capitalise consensus earnings as they are; the DCF has to earn them. Here the margin the DCF carries falls from 35% at the peak to 10% at the end, and capex stays above depreciation for years, so free cash flow converts less of the headline earnings. Neither answer is wrong; the gap measures how much of today's profitability the market is treating as permanent.

Reverse DCF: what the price needs

Holding our cost of capital and long-run assumptions, the current price requires year-one revenue growth of **184.1%** (terminal growth 8.6%) against our 168.8%. The market is therefore already pricing in more than we model; the shares need delivery above our base case to earn their cost of equity on this lens.

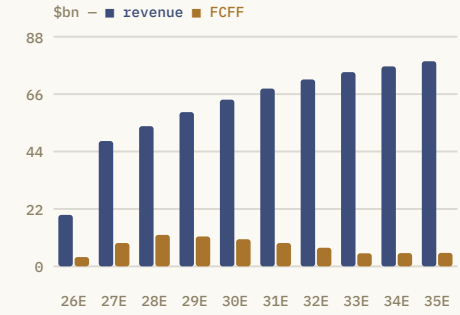

Implied multiples. At the DCF value of $537.17 the shares would trade on 4.0x NTM EPS, against 12.8x today and 17.0x for the sector. That is a useful sanity check: a DCF that implies a multiple far below any peer is usually telling us about its own conservatism as much as about the stock.

Model diagnostics

- Terminal EV/EBITDA vs today: 5.7x implied vs 382.6x current — ok
- Terminal ROIC vs WACC: 5.5% vs 9.3% — value-destructive

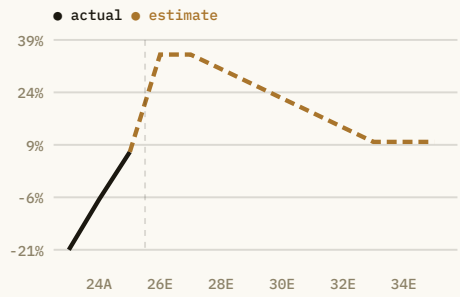

The bear and bull scenarios bracket the base value at $430.76 and $659.71; the sensitivity table on page 5 shows the effect of the discount rate and terminal growth.

MACRO CONTEXT · RELOJ DE INVERSIÓN

Where the cycle is: Stagflation, weak signal

Growth and inflation read from 28 FRED series, expressed as probabilities of four phases rather than a single label.

The Reloj de inversión — our own cycle model, published as a separate project — classifies the US economy each month into one of four phases from growth and inflation. Its latest reading (2026-10) is **Stagflation** (the Reloj's "Estanflación") with **weak** conviction: 37% against 36% for Overheat.

How the Reloj reads the cycle

Twenty-eight FRED series are converted to robust z-scores and combined by principal components into a growth axis and an inflation axis; the month's position on that plane, and its uncertainty, give a probability for each phase. A phase is Recovery (growth above trend, inflation below), Overheat (both above), Stagflation (growth below, inflation above) or Reflation (both below).

The current reading

Growth sits at **−0.01σ** and inflation at **+0.19σ** of their ten-year norms, i.e. close to the centre of the plane, where phase calls are least reliable. Over three months growth has moved −0.04σ and inflation −0.07σ. The model's 12-month recession probability is **8%**.

Why a weak signal changes how we use it

Only 1.1 percentage points separate the first and second phase. When the call is that close, naming one phase and acting on it would be false precision; the more honest estimate is the probability-weighted one. That is what we use on the next page: each phase's historical sector return, weighted by today's phase probabilities.

What each phase has favoured

The Reloj's rotation playbook, built from the same history (inverse volatility), leans on different sleeves in each phase:

- **Recovery**: Consumer staples (22%), Health care (21%) and Materials (20%)
- **Overheat**: Consumer staples (42%), Financials (34%) and Energy (24%)
- **Stagflation**: Utilities (32%), Industrials (26%) and Semiconductors (22%)
- **Reflation**: Gold miners (20%), Consumer staples (18%) and Health care (18%)

How long in this phase. The Reloj has called Stagflation for three consecutive months, and for 68% of the last 8 years. A phase that has just changed carries more uncertainty than one that has persisted.

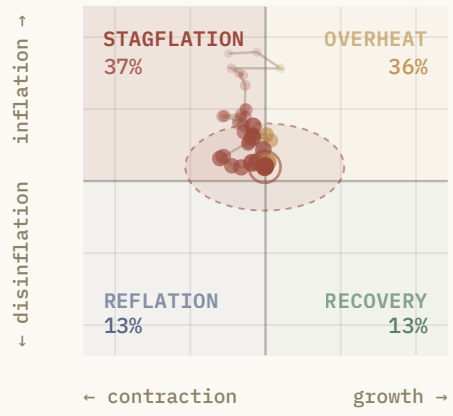

The macro read is context for the valuation. It does not move our price target, but it does tell us whether the sector a company belongs to has historically had the wind at its back or in its face.

Direction of travel. A year ago the Reloj plotted at growth −0.56σ and inflation +0.34σ; it now plots at −0.01σ and +0.19σ, a drift toward stronger growth and little change in inflation.

KEY TAKEAWAYS

- Stagflation, weak signal: 37% vs 36% for Overheat.
- Growth −0.01σ, inflation +0.19σ; 12-month recession probability 8%.
- We weight phases by probability; the label alone is not a forecast.

MACRO CONTEXT · SECTOR EVIDENCE

What the Technology sleeve has paid in each phase, and where that leaves us

Excess returns against the US market by phase, shrunk toward zero, with the statistics that say how much to trust them.

We map **Sandisk Corporation** to the Reloj's **Technology** sleeve, which it tracks through IYW and XLK; the Reloj's evidence for Technology runs back to 1970 and covers 226 months in its longest phase.

What the sector has paid in each phase

- **Recovery**: 13.3% a year on average, +2.9 pp a year versus the US market (t = +0.9, hit rate 56%, no-signal evidence)
- **Overheat**: 6.3% a year on average, −1.6 pp a year versus the US market (t = −0.5, hit rate 51%, no-signal evidence)
- **Stagflation** (current): −0.6% a year on average, −4.9 pp a year versus the US market (t = −1.5, hit rate 53%, weak evidence)
- **Reflation**: 19.6% a year on average, +5.4 pp a year versus the US market (t = +1.7, hit rate 61%, weak evidence)

Read these with the statistics in mind. A t-statistic smaller than about 2 in absolute value means the sector's return in that phase cannot be told from chance; across all sector × phase cells the Reloj tests, only 25 of 192 survive false-discovery control. That is why the Reloj shrinks every estimate toward zero, and why we quote the shrunk figure.

The probability-weighted tilt

Weighting each phase's shrunk excess return by today's phase probabilities gives a tilt of **−1.3 pp** a year for Technology against the US market. That is small relative to the noise in the estimates: a nudge, not a thesis.

Scenario: the cycle tips. If the Reloj's runner-up, Overheat, took over, the sector's historical edge would move from −4.9 pp to −1.6 pp a year. Across the four phases Technology has done best in Reflation (+5.4 pp) and worst in Stagflation (−4.9 pp).

Playbook and ETF exposure

Technology is not in the Reloj's playbook for the current phase. SNDK is the number 18 holding of the sector ETF, with a 1.29% weight. Owning the sector through its ETF carries that exposure at the weight shown; owning the stock adds single-name risk the sector evidence does not measure.

Putting the cycle and the valuation together

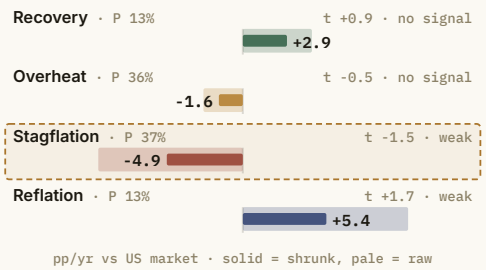

Valuation (−29%) and the cycle's tilt (−1.3 pp a year) are both negative, so we see no offsetting argument for the shares.

KEY TAKEAWAYS

- Technology tilt −1.3 pp a year, probability-weighted; current-phase edge −4.9 pp.
- Not in the playbook for the current phase.
- Context for the valuation, not an input to the target.

Source: Reloj de inversión, github.com/Perez849/reloj-inversion. The tilt describes historical behaviour; it is not an input to the target and not investment advice.

FACTORS, CATALYSTS AND RISKS

What moves the stock, and what could go wrong

Exposure scored from the model's sensitivities and the company's history; levers quantified in value per share.

We scored eight macro and company-specific factors from the model and the reported history. **High exposure**: inflation / input costs, competitive erosion, execution vs expectations and pricing power / margin stability. **Medium**: interest rates / discount rate. **Low**: economic cycle / demand, credit & refinancing and capital intensity.

What moves the stock most

Inflation / input costs (high). Cost pass-through is the test: firms with pricing power hold margin through inflation; historical margin volatility shows how much of past cost shocks reached the P&L. Evidence: −100bps EBIT margin ≈ −$37.98/sh; margin σ = 11.5%.

Competitive erosion (high). Excess returns invite entry: the wider the spread, the bigger the prize for competitors — but also the bigger the buffer before growth stops creating value. A thin spread means small competitive slippage flips growth to value destruction. Evidence: Terminal ROIC−WACC spread = −382bps.

Execution vs expectations (high). The market expects more than our base — priced for execution. The equity reprices on the gap between delivery and what the tape already discounts, not on absolute results. Evidence: Implied y1 growth 184.1% vs base 168.8%.

Key risks

- Earnings are cyclically elevated: forward EPS is 20.0x the through-cycle average. A normalisation of pricing, volumes or margins would reset the earnings base the multiples are applied to.
- Our model-only target is 45% below the Street consensus ($1,975.95); where the model is right the stock has an information edge, where it is wrong the Street's inputs deserve more weight.
- Estimate risk: consensus forecasts can be revised sharply, and the forward-multiple lenses move one-for-one with the earnings they are applied to.
- Multiple risk: target multiples are anchored on sector medians; a de-rating of the peer group lowers the target regardless of company performance.
- Single third-party data source: restatements, non-recurring items or classification differences can shift the output.

How big are the risks?

The levers behind these exposures are quantified on page 5. Translating the risks into the DCF: revenue growth 20% lower would cut the DCF value by 26%; capex +5 points of revenue would cut the DCF value by 24%; EBIT margin −300bps would cut the DCF value by 21%. These are single-factor shocks; in practice they arrive together (a de-rating and an estimate cut usually do), so the combined effect is larger than any one of them.

What we would monitor

- Delivery against the FY2026 revenue and EPS path in quarterly results, the cleanest re-rating trigger either way.
- The EBIT margin, and whether pricing, mix and cost discipline hold it near the level the DCF assumes.
- The Reloj's phase and probabilities, monthly: a move of the leading phase changes the sector's historical tilt.
- Changes to the cost of equity: rates and the equity risk premium are the single largest swing factor in the DCF.

Risks are listed in the order the model ranks them, not in order of probability; several interact (a de-rating and an estimate cut usually arrive together).

EXHIBIT 59 FACTOR EXPOSURE

FACTOR	EXPOSURE
Interest rates / discount rate	MEDIUM
Economic cycle / demand	LOW
Inflation / input costs	HIGH
Credit & refinancing	LOW
Competitive erosion	HIGH
Execution vs expectations	HIGH
Capital intensity	LOW
Pricing power / margin stability	HIGH

APPENDIX B

Methodology, definitions and disclosures

Method in one paragraph

The price target triangulates relative lenses (target multiples on consensus forward numbers, anchored on peers or a sector reference table and adjusted for durable growth, leverage and earnings durability), a 10-year DCF (consensus for the near years, a steady growth fade, mean-reverting margins) and sector models (residual income, justified P/B, FFO/AFFO, dividends, mid-cycle EBITDA), weighted by company profile. Fair value is rolled forward at the cost of equity and reduced by dividends to give a 12-month target.

Guardrails

A lens outside 0.2×–5× the share price is excluded; a lens more than 2.2× away from the median of the others is down-weighted by 60%; the published target is limited to 0.4×–2.5× the price; fewer than two usable lenses, or a result forced by a guardrail, is published NOT RATED. The Street consensus is anchored at up to 30% (scaled by analyst count; 15% when the count is unknown) and is always shown separately.

Rating bands

On the 12-month expected total return: OVERWEIGHT above +15%, ADD +5% to +15%, NEUTRAL −5% to +5%, REDUCE −15% to −5%, UNDERWEIGHT below −15%.

Scorecard scales

Valuation: expected return −30% to +50% mapped to 0–100. Growth: durable EPS growth 0–25% and FY+1 revenue −5% to +30%. Profitability: ROIC − WACC from −5 to +25 points and EBIT margin 0–35%. Earnings quality: Piotroski share of tests passed, OCF/net income 0.5–1.2 and accruals. Balance sheet: net debt/EBITDA, interest cover and Altman zone. Cycle fit: Reloj tilt −4 to +4 pp a year.

Quality screens

Piotroski F: nine binary tests of profitability, leverage/liquidity and efficiency; tests that cannot be computed from the available statement lines are excluded, not failed. Altman Z (original industrial form): above 2.99 safe, 1.81–2.99 grey, below 1.81 distress. Sloan accruals: (net income − operating cash flow) ÷ average assets.

Reloj de inversión

Phase probabilities and sector evidence come from the Reloj de inversión project's published data (github.com/Perez849/reloj-inversion). Tilt = Σ phase probability × shrunk excess return of the sector in that phase. It describes historical behaviour and is not an input to the price target.

Data and limits

Fundamentals and consensus come from the Yahoo snapshot as of 2026-07-09; the company was classified as **Standard (forward multiples + DCF)**. Forward numbers are analyst consensus where available and reported figures otherwise. A single third-party source can contain restatements, one-off items or classification differences that move the output; the model flags what it can detect and refuses to publish a number it cannot defend.

Definitions

EV: enterprise value = market capitalisation + net debt + minorities. NTM: next twelve months, a time-weighted blend of the two nearest forecast fiscal years. FCFF: free cash flow to the firm = NOPAT + D&A − capex − change in working capital. WACC: weighted average cost of capital. ROIC: NOPAT ÷ invested capital (debt + equity − cash). PEG: P/E ÷ durable earnings growth. Tilt: probability-weighted excess return of a sector against the US market, in percentage points a year.

Disclaimer

This research note is generated by an automated, sector-aware valuation engine from public data. It is an analytical tool, not investment advice, a recommendation or an offer to transact, and it is no substitute for fundamental judgement. Past performance and historical sector behaviour are not guides to future returns. Do your own due diligence.
