01 INVESTMENT THESIS

We rate **NVIDIA Corporation (NVDA) OVERWEIGHT** with a 12-month price target of **$270.37** — a +32% move from $204.12 and a +32% total return including the dividend. The shares look undervalued on 3 lenses: Discounted cash flow (FCFF), Forward P/E, Forward EV/EBITDA. Their weighted fair value today is **$237.66**, rolled forward at the 11.5% cost of equity.

NVIDIA Corporation generated $215.94bn of revenue at a 60% EBIT margin in the latest fiscal year, having compounded the top line at 100.0% over the historical window. Market capitalisation stands at $4.94trn with $51.52bn of net cash.

Consensus EPS of $12.76 gives an NTM figure of $12.76, i.e. 16.0x at today's price.

For context, the Street's mean 12-month target is $301.62 (+48%). Our model-only target of $264.86 sits 12% below it; the published target gives the consensus a 15% weight, a deliberate hedge against model error that we disclose rather than hide.

A reverse DCF shows the market is discounting year-one revenue growth of 157.2% against our 156.8% base — the price already discounts more than we model.

Priced like the sell-side prices it: a target multiple on forward earnings and EBITDA (peer-anchored, adjusted for growth and earnings durability), cross-checked against a 10-year FCFF DCF whose growth decays and whose margins mean-revert.

03 THE LENSES IN DETAIL

Each lens is an independent answer to *what is a share worth?* Relative lenses apply a target multiple to forward numbers; the DCF values the cash flows; sector lenses use the model that fits the business. Every input is shown so any number can be challenged.

Discounted cash flow (FCFF) INTRINSIC

Capital-structure-neutral cross-check to forward P/E: it values the operating business and then bridges to equity through net debt.

04 EARNINGS QUALITY & CYCLE

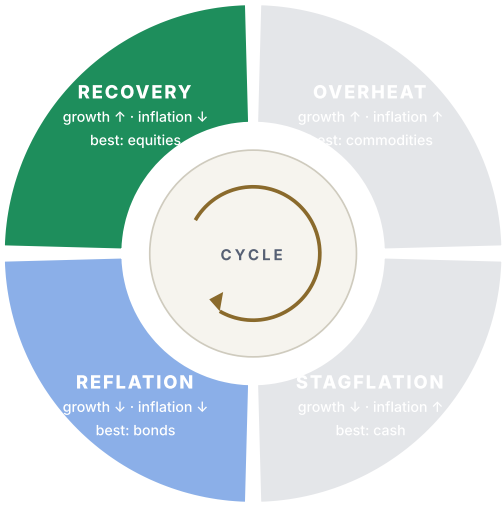

Trailing EPS	$4.90
Consensus EPS FY2027	$12.76

Consensus EPS FY2028	–
NTM EPS used	**$12.76**
Through-cycle (historical average) EPS	$2.30
Forward ÷ through-cycle	5.5x
Durable EPS growth used	14.0%
Earnings-durability factor on multiples	×1.00
Basis	consensus (single year)

No cyclicality flags. Revenue and margins show no peak-to-trough pattern in the reported history, so forward earnings are capitalised at the full target multiple.

Growth source: historical revenue CAGR (capped at 15%). Multiples price *durable* growth, so a one-year recovery step is never extrapolated, and when forward EPS is far above what the business has historically earned the target multiple is scaled down — the market pays less for peak earnings.

05 WHERE IT SITS ON THE INVESTMENT CLOCK

Recovery and **Reflation** are the phases in which Technology has historically led, on the classic Merrill Lynch Investment Clock sector map (growth × inflation, rotating clockwise: Recovery → Overheat → Stagflation → Reflation).

Illustrative sector affinity, not a call on where the economy is today: this tool reads company fundamentals and consensus, not macro data. Use it to ask whether the thesis above needs the cycle to cooperate.

08 DCF CROSS-CHECK — DRIVERS & SENSITIVITY

DRIVER	PATH	WHY
Revenue growth	156.8% → 2.5% over 10y	Year 1 follows consensus revenue for FY2027. Growth then decays geometrically from 22.0% to the 2.5% terminal rate as revenue compounds toward $1,065bn — competitive entry and the law of large numbers compress incremental growth; no single year's step is ever extrapolated.
EBIT margin	60.4% → 64.5% → 59.9% (compresses)	Reported margin is 60.4%; year-1 margin is 64.5%. This is a compounder, so we revert only 30% of the way toward the through-cycle average of 49.4%, landing at 59.9% — crediting some but not all of current profitability as durable.
Reinvestment (capex)	3.5% → 3.0% of sales	Starts at the historical capex intensity (3.5%) against D&A of 2.7%, converging to 1.10x D&A by the terminal year — a steady state that funds growth without permanent over- or under-investment.
Working capital	14.4% of Δrevenue	Incremental working capital absorbs 14.4% of each year's revenue increase (historical median) — a cash drag as the business scales.
Tax rate	13.5%	Normalised to the trailing effective rate of 13.5%, applied to EBIT to derive NOPAT.
Terminal growth	2.5%	At or below long-run nominal GDP (4.0%); a mature going concern cannot outgrow the economy in perpetuity. Terminal reinvestment is g/ROIC.

Shaded against the current price: green = above, red = below. Outlined cell = base case.

The business earns **105.9%** on capital versus a **11.4%** cost of capital — a positive spread of **9445bps**, so growth creates value. Self-funding growth of 2.5% (reinvestment 2% × ROIC) frames how much of the terminal growth is organically financed rather than assumed.

10 FACTOR SENSITIVITY MAP — WHAT MOVES THIS STOCK

TYPE	FACTOR	EXPOSURE	EVIDENCE	WHY / MECHANISM
Macro	**Interest rates / discount rate**	HIGH	75bps of WACC ≈ $16.88/sh (9%); TV = 47% of EV	Long-duration cash flows: the further out the value sits (terminal-heavy), the more a shift in rates or the equity risk premium re-prices the stock, independent of operations.
Macro	**Economic cycle / demand**	HIGH	Revenue growth volatility σ = 26.2% over 3y	Historical top-line dispersion is the cleanest read on cyclicality: a stable compounding base decouples from GDP; a volatile one imports the macro cycle into earnings.
Macro	**Inflation / input costs**	LOW	−100bps EBIT margin ≈ −$3.31/sh; margin σ = 16.9%	Cost pass-through is the test: firms with pricing power hold margin through inflation; historical margin volatility shows how much of past cost shocks reached the P&L.
Macro	**Credit & refinancing**	LOW	Net cash position; EBIT/interest = 503.4x	A net-cash balance sheet removes refinancing risk and turns higher rates into interest income rather than a cost.
Micro	**Competitive erosion**	LOW	ROIC–WACC spread = 9,445bps	Excess returns invite entry: the wider the spread, the bigger the prize for competitors — but also the bigger the buffer before growth stops creating value. A thin spread means small competitive slippage flips growth to value destruction.

TYPE	FACTOR	EXPOSURE	EVIDENCE	WHY / MECHANISM
Micro	**Execution vs expectations**	LOW	`Implied y1 growth 157.2% vs base 156.8%`	Market expects MORE than our base — priced for execution. The equity reprices on the gap between delivery and what the tape already discounts, not on absolute results.
Micro	**Capital intensity**	MEDIUM	`Capex/D&A = 1.26x; capex = 3.5% of sales`	Above 1x, the business must keep buying its own growth — FCF conversion stays hostage to the reinvestment cycle; below 1x, depreciation overstates true capital needs and cash conversion runs ahead of earnings.
Micro	**Pricing power / margin stability**	HIGH	`EBIT margin σ = 16.9% (range 21%–62%)`	Stable margins across cycles are the fingerprint of pricing power; wide swings say the company is a price-taker whose profitability belongs to the environment, not the franchise.

11 CATALYSTS & WHAT EACH LEVER IS WORTH

- **Cost of capital:** every 75bps of WACC moves fair value by ≈$16.88/share (9%). Rate path and the equity risk premium are the single biggest swing factor.
- **Terminal growth:** 50bps of perpetuity growth is worth ≈$5.11/share — the market's read on the company's long-run competitive position.
- **Operating margin:** each 100bps of EBIT margin across the forecast is worth ≈$3.31/share — watch pricing power, mix and cost discipline in quarterly prints.
- **Top-line delivery:** our base assumes 156.8% year-one growth fading to 2.5%; sustained beats/misses versus that glide path are the cleanest re-rating trigger either way.

12 KEY RISKS

- Estimate risk: consensus forecasts can be revised sharply, and the forward-multiple lenses move one-for-one with the earnings they are applied to.
- Multiple risk: target multiples are anchored on sector medians; a de-rating of the peer group lowers the target regardless of company performance.
- Single third-party data source: restatements, non-recurring items or classification differences can shift the output.

Methodology & disclaimer. Generated by an automated, sector-aware valuation engine from public data (Yahoo snapshot as of 2026-07-08). NVDA was classified as **Standard (forward multiples + DCF)**. The 12-month price target triangulates several lenses — target multiples on consensus forward earnings (peer/sector-anchored and adjusted for durable growth, leverage and earnings durability), a 10-year DCF with decaying growth and mean-reverting margins, and sector-specific models — weights them by profile, applies plausibility guardrails, rolls the result forward at the cost of equity net of dividends, and lightly anchors it to Street consensus when available. Reference multiples are long-run developed-market medians; live peer medians replace them when fetched. Forward numbers come from analyst consensus where available and from reported figures otherwise; they are not a substitute for fundamental judgement. Nothing here is investment advice, a recommendation, or an offer to transact. Do your own due diligence.
